# Real golf performance.

SYNLawn Golf® have worked with some of Golf's greatest minds to develop the most realistic performing synthetic golf grasses available. Now you too can create your own golfing oasis, just like the pros use, right in your own backyard.

*"The ball comes out, just  
the way I want it to.  
Just like it's a real green."*

*Tom Watson*

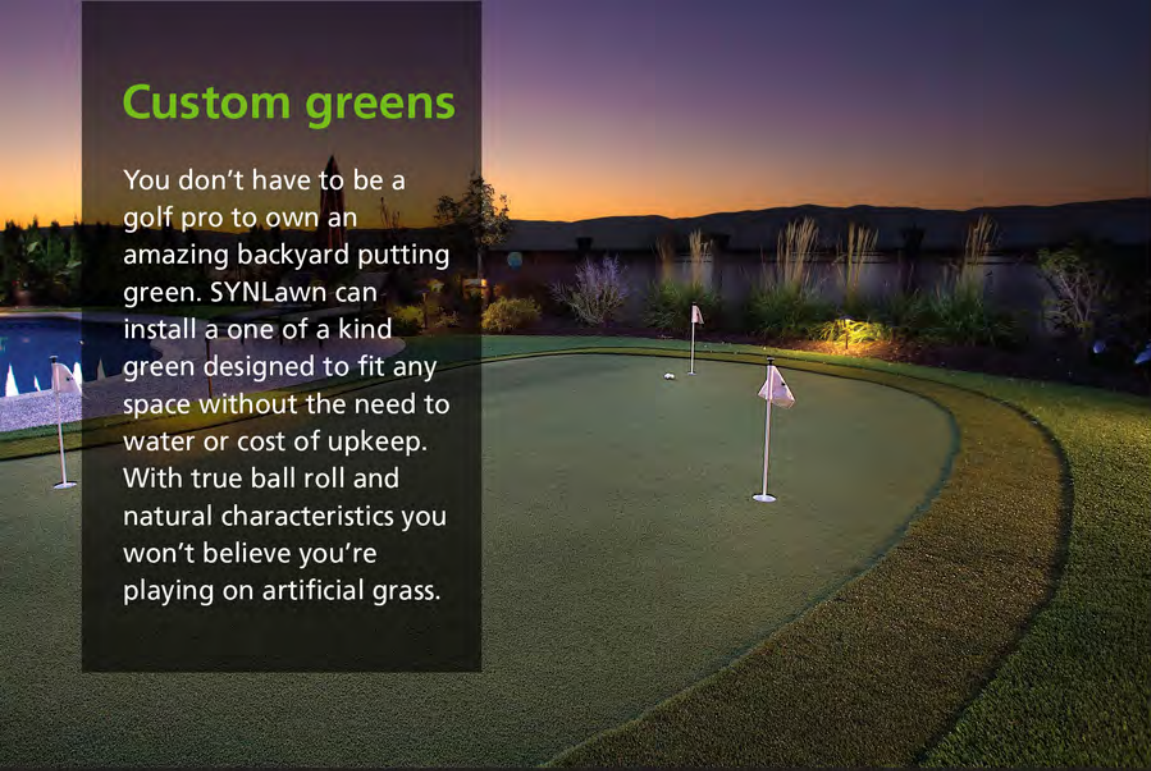

SYNLAWN

GOLF

## Custom greens

You don't have to be a golf pro to own an amazing backyard putting green. SYNLawn can install a one of a kind green designed to fit any space without the need to water or cost of upkeep. With true ball roll and natural characteristics you won't believe you're playing on artificial grass.

## For Tee Lines

Ideal for golfers working on their approach, our Tee Strike is made using dense nylon fibers which won't grab the clubhead and allow for use of golf tees just as you would on any golf course tee box or driving range. Built with superior strength and durability for years of practice in any climate.

## For Real Golf

Created to replicate the conditions found during all phases of the game, our synthetic golf grass simulates all the elements found on courses at the tournament level. Our close attention to the details of our fairway, fringe and collar grasses can make a huge impact on your overall game.

Our **GreensMaster™ Certified** installations ensure the best conditions for your game.

Exclusive **Dave Pelz ShotStopper™** technology absorbs ball energy to practice once impossible shots.

## For Real Fun

Having a beautiful green in your backyard can not only help your game, it can also serve as a great space for entertainment. Just imagine all the fun you could have outdoors while having a barbeque, competing against your friends or teaching the kids how to play instead of moving the lawn.

## Golf by Pelz

Years of research by golf guru and former NASA physicist Dave Pelz have resulted in developing the most realistic artificial golf grass ever made. To maximize these benefits Mr. Pelz has also created the 'Elements of Practice', a series of drills and games only found at [SYNLawnGolf.com](http://SYNLawnGolf.com)

# 'Green' all over

SYNLawn® is green on top, in the middle and even underneath. Beyond the color, SYNLawn goes a long way toward environmental sustainability, taking measurable steps to be truly "green". Made in the USA, our biobased products are 100% recyclable, using renewable and recycled materials during the manufacturing process. Using SYNLawn can reduce your carbon footprint by conserving water, eliminating emissions from lawn equipment, and lowering the impact on landfills due to its long life expectancy.

SYNLawn's exclusive EnviroLoc™ Backing System has an enhanced multi-layer component system that "locks" in durable turf fibers, extending the product's lifecycle. Engineered using BioCel™ technology, the EnviroLoc™ Backing System replaces a large portion of petroleum-based polymers with bio-based polymers created from soybean plants (a rapidly renewable resource). We then add Celceram™ (a recycled product of coal combustion) for superior strength and dimensional stability. Together these biobased technologies provide an environmentally responsible approach to artificial grass that conserves Earth's natural resources and will look great for years to come.
